

All OASIS dehumidifiers supplied with a hot gas defrost system use an electronic timer board to control operation of the hot gas solenoid valve.

The current supplier of this control board is transferring production to Asia in order to reduce costs. However, this impacts on logistics - delivery lead-times will increase significantly. In order to maintain the ability to process customer orders promptly, OASIS has decided to source the control board from a European manufacturer.

Sample boards have been on extended field tests since March 2015 and have been independently tested and certified as meeting the requirements of all relevant safety legislation.

It is expected that the new board will be introduced into production units in early 2016

Original Timer Board: 032189-004

New Timer Board: 032189-006
